This is interpreted to mean that our knowledge of physical systems is more certain than our knowledge of biological systems, and these in turn are more certain than our knowledge of social systems. In terms of our capacity to sample the relevant universes, however, and the probability that our images of these universes are at least approximately correct, one suspects that a reverse order is more reasonable. We are able to sample earths social systems with some degree of confidence that we have a reasonable sample of the total universe being investigated. Our knowledge of social systems, therefore, while it is in many ways extremely inaccurate, is not likely to be seriously overturned by new discoveries. Even the folk knowledge in social systems on which ordinary life is based in earning, spending, organizing, marrying, taking part in political activities, fighting and so on, is not very dissimilar from the more sophisticated images of the social system derived from the social sciences, even though it is built upon the very imperfect samples of personal experience. In contrast, our image of the astronomical universe, or even of earths geological history, can easily be subject to revolutionary changes as new data comes in and new theories are

worked out. If we define the “ security ” our image of various parts of the total system as the probability of their suffering significant changes, then we would reverse the order of hardness and see the social sciences as the most secure, the physical sciences as the least secure, and again the biological sciences as somewhere in between. Our image of the astronomical universe is the least secure of all simply because we observe such a fantastically small sample of it and its record-keeping is trivial as compared with the rich records of the social systems, or even the limited records of biological systems. Records of the astronomical universe, despite the fact that we see distant things as they were long ago, are limited in the extreme. Even in regard to such a close neighbour as the moon, which we have actually visited, theories about its origin and history are extremely different, contradictory, and hard to choose among. Our knowledge of physical evolution is incomplete and highly insecure. 31. The word “ paradox ” (Para. 1, Line 1) means “ ” A) implication B) contradiction C) interpretation D) confusion 32. According to the author, we should reverse our classification of the physical sciences as “ hard ” and the social sciences as “ soft ” because .A) a reverse ordering will help promote the development of the physical sciencesB) our knowledge of physical systems is more reliable than that of social systemsC) our understanding of the social systems is approximately correctD) we are better able to investigate social phenomena than physical phenomena 33. The author believes that our knowledge of social systems is more secure than that of physical systems because . A) it is not based on personal experienceB) new

discoveries are less likely to occur in social sciencesC) it is based on a fairly representative quantity of dataD) the records of social systems are more reliable34. The chances of the physical sciences being subject to great changes are the biggest because .A) contradictory theories keep emerging all the timeB) new information is constantly coming inC) the direction of their development is difficult to predictD) our knowledge of the physical world is inaccurate 35. We know less about the astronomical universe than we do about any social system because .A) theories of its origin and history are variedB) our knowledge of it is highly insecureC) only a very small sample of it has been observedD) few scientists are involved in the study of astronomy 100Test 下载频道开通，各类考试题目直接下载。详细请访问 www.100test.com
